EDUCATION

Master of Science

Software Engineering
Rochester Institute of Technology

Expected May 2026

4.0 GPA

Bachelor of Science

Biomedical Science
University at Buffalo

May 2024

TECHNICAL SKILLS

Java
Python
node.JS

React.js
C++
Ruby

SQL Database Management
Refactoring Processes
TDD

RESEARCH

Jan 2025 - Present

- Conducting research on breast cancer screening using dynamic infrared thermography to explore non-invasive diagnostic methods.
- Collaborating with a faculty advisor on a capstone project to develop a software tool that detects patient acclimatization to baseline environmental conditions.
- Authored multiple literature reviews analyzing recent studies on the use of thermography in breast cancer detection, focusing on trends, limitations, and potential improvements.

PERSONAL PROJECTS

Multi-User Party Planner (Event Planning Application)

Feb 2025 - Present

- Tech Stack: PostgreSQL, Python server with Flask API, React, and TypeScript.
- Developing RESTful backend APIs using Flask and PostgreSQL to support user login, event form creation, and preference-based group generation in a multi-user party planning web app.
- Implementing a secure user authentication and account management system, enabling organizers to create and manage roles for customizable events.
- Designing a relational database schema to support dynamic form inputs, matching scores, and event scheduling logic.
- Collaborating in a Scrum team of 5 graduate students, contributing to sprint planning, code reviews, and daily standups to ensure timely delivery of MVP features.
- Supported full-stack development and cross-functional integration with the React + TypeScript frontend team to enable seamless user experience across roles.

BetterMaps (Campus Navigation Android Application)

Sept 2024 - December 2024

- Tech Stack: Android Studio, Java, Google Cloud Console, PostgreSQL
- Collaborated with a scrum team of four other graduate Software Engineering students to create an intuitive platform that helps users easily navigate campus using real-time map data and personalized features.
- Utilized the Google Maps API, and Java, to integrate detailed tunnel routes, building layouts, and location-based services.
- Key features include the ability for users to save preferred locations and routes, and access faculty office hours and building operating hours for improved campus accessibility.
- Focused on delivering a seamless user experience through a combination of efficient location tracking, intuitive UI design, and real-time data updates.

PROFESSIONAL EXPERIENCE

Software Coach

Oct 2014 - Present

Southern Tier Robotics Team

- Lead development of control systems for robotics using C++, focusing on efficiency and innovation.
- Guide team members in coding and problem-solving during the build season and regional competitions.
- Coordinate meetings and regional event participation, contributing to team success at multiple competitions.
